

IDENTIFICATION OF A GAS TURBINE ENGINE MATHEMATICAL MODEL BY THE RESULTS OF TESTING

© 2008 S. K. Botchkaryov, A. Ya. Dmitriyev

Samara State Aerospace University

The paper deals with the identification of a linear mathematical model of gas turbine engines by the results of testing using the simplest Huber method with regard to additional information on engine parameter measurement error and possible magnitudes of parameter variations characterizing unit operation.

Linear model, engine parameters, unit parameters, evaluations, stable methods, purpose function, additional information.

Botchkaryov, Sergei Konstantinovich, deputy pro-rector on science and innovations, candidate of technical science, associate professor, SSAU. Area of research: theory and testing of engines, automation of scientific research, organization of scientific research.

Dmitriyev, Alexander Yakovlevitch, candidate of technical science, associate professor, department of aircraft construction and quality control in machine building, SSAU. Area of research: automation of processing of experimental research results, identification of mathematical models.
