The paper deals with the question automatization of models of basic business processes of press forging design-and-technological preparation. Ways of reducing the time of technological preparation of production due to the use of computer-aided document turnover in production processes are shown. The use of a resource-oriented approach for the modeling of industrial subject area is proposed, the required functional model decomposition indicator is defined on the basis of document status, data model patterns are specified.

*Business process, design-and-technological preparation of production, press forging, document life cycle*
