

CHARACTERIZATION OF OPTICAL VORTICES FOR MICROMANIPULATION PURPOSES

© 2008 A.A. Morozov

Samara State Aerospace University

Light beams with the orbital angular momentum in the problem of optical trapping and rotation of micro-objects are studied. Diffractive optical elements that generate a set of concentric rings of equal intensity for the optical trapping and rotation of opaque micro-objects are considered.

Vortical beams, gradient forces, hypergeometrical beams
