The research results of power-consuming discrete and electroabrasive grinding processes are presented. It is demonstrated, that in comparison with an ordinary abrasive grinding these processes ensure a considerable power specific expenditure decrease and therefore may be considered as perspective, resource saving processes.

Grinding, steel, thermal conductivity, assembled, composite, working conditions

Skuratov Dmitry Leonidovich, Doctor of Engineering Science - professor of Samara State Aerospace University “Mechanical Material Working” department. E-mail: mom@ssau.ru. Area of research: efficiency improvement and reliability control on final stages of heat-engine components manufacturing through determination of rational conditions and working techniques.

Trusov Vladimir Nikolaevich, Doctor of Engineering Science – professor of Samara State Technical University. E-mail: isap@samgtu.ru. Area of research: productivity improvement and reliability control on final stages of heat-engine components manufacturing through determination of rational conditions and working techniques.
